

4.

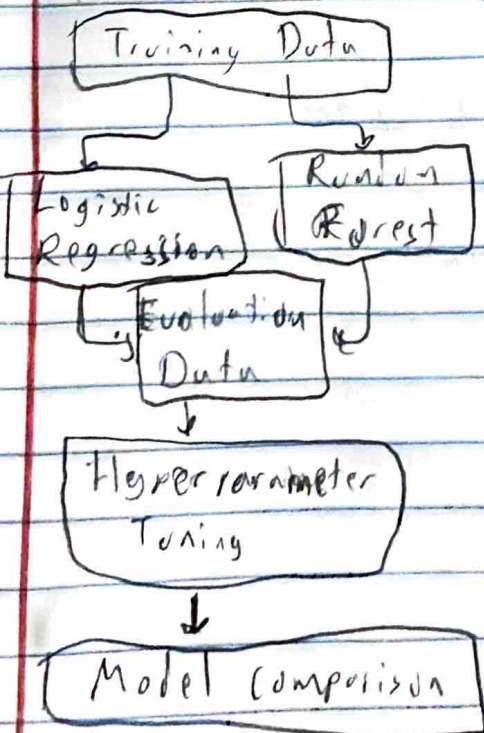

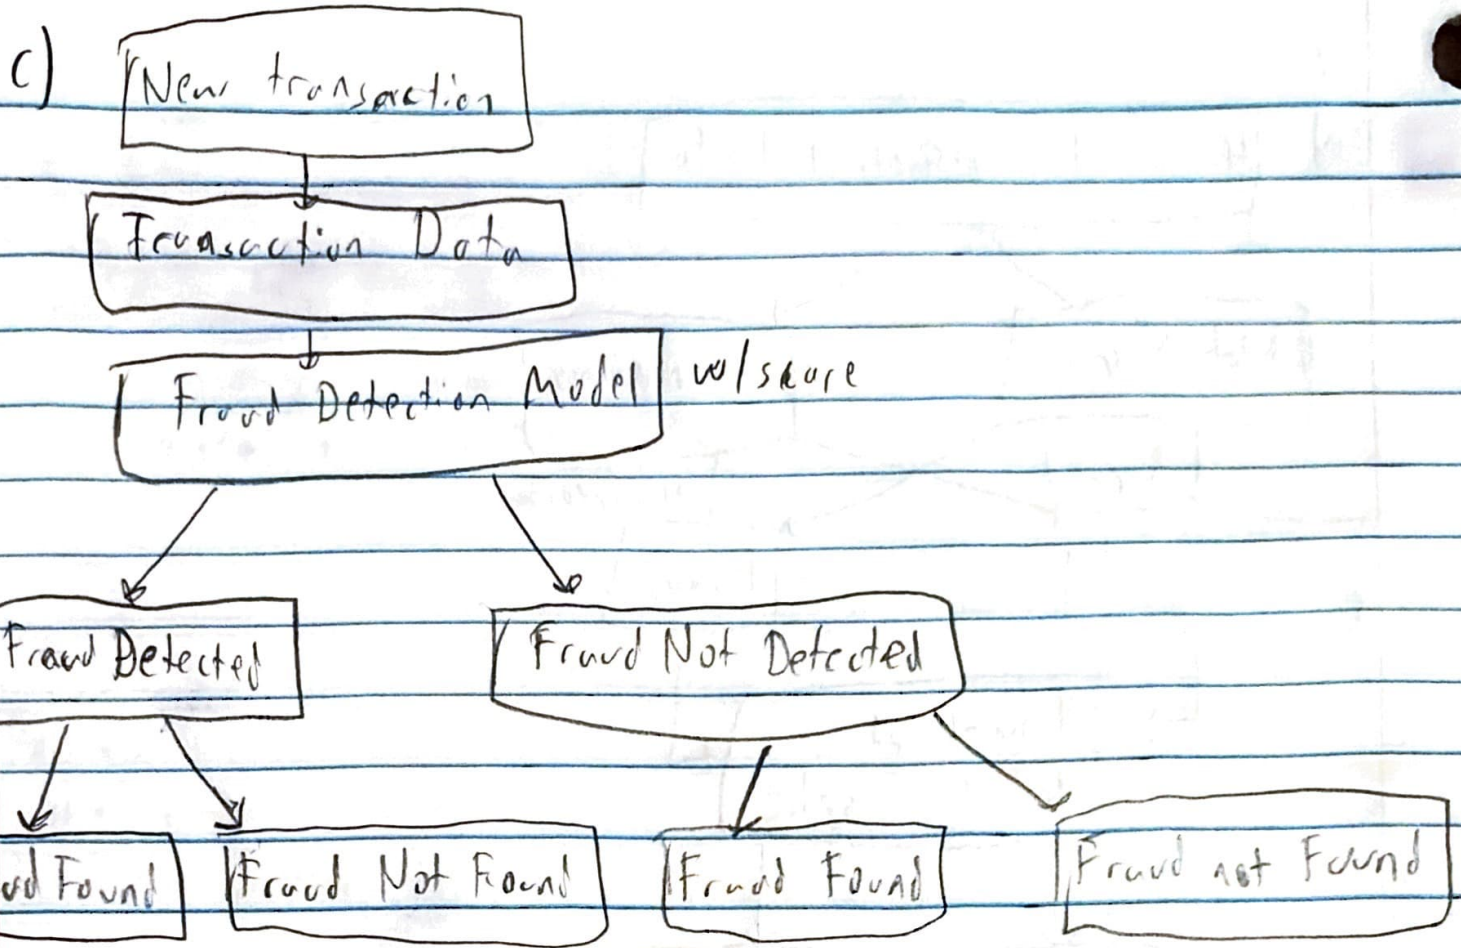

Target leakage could occur when the transactions are not suspicious and actually fraud. The investigators would not investigate the fraud and it would not be logged.

developed by running

b) Candidate models are multiple different models with new features and new hyperparameters. After developing models,

using evaluation data, we could do a model comparison to find the best fit model.

d) Price, location, time, purchase items, merchant, customer history, will be available before prediction. What will be available after prediction is the customer report and investigator reviews.

e) Customer reports and investigators will update the model to predict new frauds. The not investigated transactions are probably not going to be noticed. This will cause model to label incorrectly and make an unfit model.
